Evaluating the dissertations related to nursing and job satisfaction

Nilay Ercan Şahin, Nilgün Kuru, Oya Nuran Emiroğlu
Hacettepe Üniversitesi, Hemşirelik Fakültesi

Objective: This research was carried out to evaluate dissertations which were related to job satisfaction in nursing as a descriptive study.
Materials-Methods: Between 2004-2014 years, dissertations were searched "nursing" and "job satisfaction" with Keywords in all areas which had been published Higher Education Institution online thesis center and were accessible. For this purpose, 71 dissertations were reached and examined "type, department, the published year, thesis topic, research type, sample determine type, questionnaire and scale form".
Results: It was determined, 74.6% of dissertations were done in the nursing area and 25.4% in the other areas (midwifery, business management, psychology and public health). It was found that dissertations of 91.5% were the master's dissertations and 24% were made in the Department of Nursing Management. Looking at the distribution by years of dissertations 60.5% were made between 2010 and 2013. While 32% of dissertations were in order to determined their level of job satisfaction, 10% were determined the relationship between the organization culture and job satisfaction. Also, %81.6 of dissertations were done as descriptive type. 79% of the studies sample group were comprised of nurses. 74% of dissertations weren't used any sampling method and sample consists of the people who agreed to participate in the study. 53.8% of dissertations, Minnesota Job Satisfaction Scale was used to assess job satisfaction. %49.4 of studies were not been tested the reliability and validity and % 45 were measured Cronbach's alpha reability coefficent.
Conclusion: This study is considered to be a guiding one for future studies that will be conducted in the light of gained findings.

Keywords: Nursing, job satisfaction, dissertation
